Introduction

There is no consensus about surgical approach in cases of Caesarean section scar (CSSP) and interstitial (ISP) ectopic pregnancy.

We present two cases of ectopic pregnancies successfully managed by minimally invasive surgical technique: hysteroscopic resectoscope (HR) removal of retained products of conception (RPOC).

The raising trend in minimally invasive surgery offers new treatment modalities.

Case 1: 50 mg mthx HR, leaving chorionic sac in situ after 3 months: vacuum aspiration

Case 2: HR removal of ectopic interstitial pregnancy in left cornu

The incidence of CSSP is around 1:1,800 to 1:2,220.

Successful minimally invasive treatment using HR in both CSSP and ISP may be applied.
