Introduction:
The sonographic and clinical characteristics of chronic ectopic pregnancy is not well described. We present our imaging and clinical correlates in this case series.

Materials and Methods:
Ten cases of chronic ectopic pregnancy presented to our institute over a period of 4 years from March 2014 to March 2018. Data was collected prospectively and analysed retrospectively.

Clinical Findings:

- Bleeding PV
- Pain abdomen
- Retention

Clinical findings

- High degree of suspicion is required to diagnose chronic ectopic pregnancy as UPT may be negative.
- An empty uterine cavity with a heterogenous mass in the POD with absent vascularity on Doppler clinches the diagnosis pre-operatively.
