Aim of the study
➢ to correlate type and degree of adenomyosis, scored through a new system based on transvaginal sonographic (TVP) features, to patient’s symptoms and fertility.

Methods
➢ A new ultrasonographic scoring system designed to assess the severity and the extent of uterine adenomyosis was used to stage the disease in correlation with clinical symptoms. Menstrual bleeding was assessed by a pictorial blood loss analysis chart, painful symptoms were evaluated using a visual analogue scale and infertility factors were considered.

Conclusions: The ultrasonographic evaluation of the type and extension of adenomyosis in the myometrium seems to be important in correlation to the severity of symptoms and infertility.
