(P14.06). Caesarean scar pregnancy: a challenging early pregnancy dilemma

Sadia Malick, Fatema M. Alhajeri, Anjum R. Syed, Corniche Hospital - Abu Dhabi.

**Objectives:** We aim to review different treatment modalities employed in our unit to reduce maternal morbidity, Mortality, preserve fertility, and minimize complications.

**Methods:** We offered suction evacuation under ultrasound guidance with a backup of cervical occlusion stitch for endogenous CSP and other surgical options for exogenous scar ectopic pregnancy.

**Conclusions:** Suction evacuation under scan guidance and cervical occlusion stitch at GA < 10 weeks is a safe and effective method in the management of Cesarean scar pregnancy if performed using predefined diagnostic criteria of endophytic and exophytic scar.
