Introduction
Improving placenta accreta diagnosis is a key to improve care

Material and Methods
Prospective, between January 2014 and July 2017

Investigated by MRI, sonography and MRI sonography fusion

Use a blindly assess score to evaluate the risk of placenta accreta

Gold standard: histological analysis

Results
MRI sonography fusion: specificity 78.3%, sensibility 88.9%

Conclusion
Better concordance rate for MRI sonography fusion

Feasibility of this new imaging method
